

Heat vs Temperature

Present .-
Σlen N.B
Jo P

Excused, Demos

Heat (symbol: Q) is energy. It is the total amount of energy (both kinetic and potential) possessed by the molecules in a piece of matter. Heat is measured in Joules.

Temperature (symbol: T) is not energy. It relates to the average (kinetic) energy of microscopic motions of a single particle in the system per degree of freedom. It is measured in ^{S.I.} Kelvin (K), Celsius (C) or Fahrenheit (F).

heat

c

°C

A

Energy
= 200 J

B

Energy
= 200 J

C

Heat - $\Sigma k + \Sigma p$

Temperature - only Σk measure of the average kinetic energy of the particles

Definition:	Heat is energy that is transferred from one body to another as the result of a difference in temperature.	Temperature is a measure of hotness or coldness expressed in terms of any of several arbitrary scales like Celsius and Fahrenheit.
Symbol:	Q	T
Unit:	Joules	Kelvin, Celsius or Fahrenheit
SI unit:	Joule	Kelvin
Particles:	Heat is a measure of how many atoms there are in a substance multiplied by how much energy each atom possesses.	Temperature is related to how fast the atoms within a substance are moving. The 'temperature' of an object is like the water level - it determines the direction in which 'heat' will flow.
Ability to do work:	Heat has the ability to do work.	Temperature can only be used to measure the degree of heat.

Kelvin temperature conversion formulae

	from Kelvin	to Kelvin
Celsius	$[^{\circ}\text{C}] = [\text{K}] - 273.15$	$[\text{K}] = [^{\circ}\text{C}] + 273.15$
Fahrenheit	$[^{\circ}\text{F}] = [\text{K}] \times \frac{9}{5} - 459.67$	$[\text{K}] = ([^{\circ}\text{F}] + 459.67) \times \frac{5}{9}$
Rankine	$[^{\circ}\text{R}] = [\text{K}] \times \frac{9}{5}$	$[\text{K}] = [^{\circ}\text{R}] \times \frac{5}{9}$

	Kelvin	Celsius	Fahrenheit
Water boils	373.16K	100°C	212°F
Water freezes	273.16K	0°C	32°F
Absolute zero	0K	-273.16°C	-459.7°F

Comparison of Temperature Scales

[Sou

	Kelvin (K)	Celsius (°C)	Fahrenheit (°F)
<i>Absolute zero</i>	0	-273.15	-459.67
<i>Lowest recorded natural temperature on Earth (Vostok, Antarctica - July 21, 1983)</i>	184	-89	-128.2
<i>Water freezes (at standard pressure)</i>	273.15	0	32
<i>Average surface temperature on Earth</i>	288	15	59
<i>Average human body temperature</i>	309.95	36.8	98.24
<i>Highest recorded surface temperature on Earth (Al 'Aziziyah, Libya - September 13, 1922)</i>	331	58	136.4
<i>Water boils (at standard pressure)</i>	373.1339	99.9839	211.97102
<i>Titanium melts</i>	1941	1668	3034
<i>The surface of the Sun</i>	5800	5526	9980

Convert the following temperatures in degrees Celsius ($^{\circ}\text{C}$) to $^{\circ}\text{F}$.

(a) 0°C

(b) 100°C

(c) -60°C

(d) -37°C

(

Convert the following temperatures in degrees Celsius ($^{\circ}\text{C}$) to $^{\circ}\text{F}$.

$$(a) \quad 0^{\circ}\text{C} \quad \vdots \quad = \quad 32^{\circ}\text{F}$$

$$(b) \quad 100^{\circ}\text{C} \quad \vdots \quad = \quad 212^{\circ}\text{F}$$

$$(c) \quad -60^{\circ}\text{C} \quad \vdots \quad = \quad -76^{\circ}\text{F}$$

$$(d) \quad -37^{\circ}\text{C} \quad = \quad - \quad ^{\circ}\text{F}$$

Conduction
(via direct contact)

- Conduction is the direct flow of heat through a material resulting from physical contact.

Convection
(via fluid)

Liq
gas

- heat transfer between a surface and adjacent fluid (gas, air or liquid) and by the flow of fluid from one place to another, induced by temperature

Radiation
(via electromagnetic Radiation)

- No transfer medium required
- It's the transfer of thermal energy through matter of space by electromagnetic waves.

Micro x rays
UV rays, waves
radio waves, gamma rays

↳ Conductor: good at conducting

heat from one point
to another within the
material as it has
free electrons.

[Metals]

D, β, A, C

Insulator: Are not good at
conducting from one
point to another
as they do not have
free electrons within.

e.g. Non-Metals
